

## What is The Inman Aligner ?

6

New innovations in Orthodontic appliances have brought quicker more aesthetic systems in tooth movement such as the Inman Aligner allowing crowding and spacing to be corrected in a matter of weeks.

Until now, the alternatives to straighten front teeth involved either long and expensive orthodontic treatments or potentially destructive restorative treatments such as veneers or crowns. Even ultrathin veneers involve reduction of natural teeth when used to align crowding or prominent front teeth.

But with the arrival of the Inman Aligner, all that has changed.

The Inman Aligner is a cost-effective removable orthodontic appliance that moves teeth in a fraction of the time of other systems. It aligns crowded or protruding anterior teeth with two opposing spring loaded aligner bars. This provides gentle but continuous pressure over a large range of movement. Surprisingly, this gentle pressure is the quickest way to move teeth but it also makes treatment very safe and kind to teeth.

People love the speed of treatment and it's changing the face of dentistry as we know it. The average treatment time is only 4-16 weeks and now with concerns over the economy it's a more justifiable expense.

Only certified Inman Aligner dentists can provide them. It is important to ensure your chosen dentist has the right credentials.
